

The single greatest indicator of whether or not you will survive a cancer diagnosis is health insurance status.

Cancer is the leading cause of death in North Carolina.¹

Breast cancer patients living in states with the lowest income eligibility for Medicaid (<50% FPL) had a **31% greater mortality risk** than states with expanded eligibility. Patients with other types of cancer had similar increased mortality.²

Uninsured patients are **less likely to be screened for cancer**, increasing chances of an advanced diagnosis where survival is less likely and care is more expensive.³

*"If you are **uninsured**, and you are diagnosed with cancer, you have a **60% greater chance of dying from cancer** than if you were insured and diagnosed with cancer."*

Dr. Otis Brawley, former Chief Medical Officer, American Cancer Society

Increasing eligibility for health insurance through Medicaid may help **improve cancer diagnosis and survival**.²

Closing the coverage gap would improve access to screening and timely symptom evaluation, which promotes early detections and improved outcomes for patients.⁴

States that closed their coverage gap saw **lower mortality** in **breast, colon and lung cancer** compared to states that have not closed the gap.⁴

Closing the coverage gap means more cancer survivors in North Carolina.
